

SAP Inside Track

Vibe coding & AI-infused development in SAP

Maxime Brusselle

September 19th 2026

Agenda

01 Framing

02 The SAP landscape today

03 The showroom model

04 Spexso

05 Wrap-up & next steps

Framing

What is AI-infused development in the SAP world?

Vibe coding

A focused copilot — not an autopilot

What it's NOT

- **Vibe coding:** prompt in, code out, ship it
- A replacement for an experienced SAP architect or developer
- A magic button that takes over the thinking
- Trustworthy where security, compliance and performance are critical

What it IS

- **AI-infused development:** A copilot across the full development cycle
- Dozens of small accelerations
- Less repetitive work, more focus on business value
- The human stays responsible for choices and quality

AI helps across the whole lifecycle

Analysis

Sharpen requirements,
structure use cases, explore
solution directions

Development

Data models, services, code
fragments, unit tests and
documentation

Finishing

Refactoring, explaining code,
test coverage, consistency,
hand-over docs

The developer stays responsible for the choices, the architecture and the final quality.

Why SAP is different: context wins

Business objects & data models

Released APIs & integration patterns

Authorizations & security

Extensibility and UI5 guidelines

Clean-core principles

Performance & compliance

FRAMING

Why SAP is different

The SAP landscape today

What are available tools for an SAP developer?

ABAP: concrete steps are being taken

Eclipse ADT (ABAP Development Tools)

Understands framework nuances

ABAP MCP server support

Clean core feedback

ABAP: concrete steps are being taken

June 2026: **ABAP Development Tools for VS Code**

SSO & Basic Authentication

ABAP MCP server

Custom agents

Honest: new territory

- Internal evaluations just started
- Promising, but not yet mature

BTP as platform, Joule as AI layer

Extensions and automations

BTP: full-stack, extensibility & orchestration

1

Joule for Developers

2

**SAP Build VS Code
extension**

3

Agent orchestration

Our Flexso approach

AI as an accelerator

Showroom model

Our new approach

Before: Static

Two weeks preparation

- Screenshot mockups
- Invented data
- Heads-down, apart

Now: Interactive

Standard setup before we start

- Flexso + Fiori guidelines live in an AI workflow
- Time to solve the right problem
- Code to start further development from

Meet the team

ORCHESTRATOR

Runs the whole
process.

AS THE PROJECT NEEDS

How it works

1 Discovery phase

2 Design phase

3 Prototype build

4 Implementation plan

Demo

Showroom model

Facades: what still needs to be built

Authentication

Data model

Multitenancy

Connectivity

CI/CD

Quality & i18n

That's why developers are still essential

Architecture

Security

Testing

Documentation

Spexso

Spec-driven development for Flexso teams

Four pillars, one golden rule

Docs over meetings

AI as a team member

Docs in 1 place

Async-first, meeting-last

Documentation matters: write once, understand always.

The intelligence shifts to the documentation

Before

Now

Every unit of work: the same 6 stages

Every unit of work: the same 6 stages

The orchestration loop: four steps, one artifact each

What's still not possible

An accelerator — not a replacement

Expertise stays necessary

AI generates code

The brainstorm step is human work

More output means more to review

Security needs deliberate attention

Recap and future steps

SAP is developing useful AI tools

AI is lowering the threshold for designing own frameworks and tools (Showroom model & Spexso)

Context is everything

With useful context and documentation, AI accelerates your entire development cycle

Stay curious, stay ahead

Follow new AI and SAP developments, try new tools and adapt your workflow as you go
