The Problem

Question 1: Which iFlows target a service at *https://demo.dev* and will be affected by its decommissioning?

Question 2: Are there any iFlows calling Internet-facing APIs without authentication?

Question 3: How many iFlows use an outdated version of the Advanced Event Mesh sender adapter?

Question 4: Do any iFlows violate authentication security standards?

**How much time do you think
it will take to answer
these questions?**

The Problem | **Time To Answer**

iFlow count

20-25

iFlow complexity

low to medium

(mostly linear flow logic,
less than 15 steps per iFlow)

The Problem | **Time To Answer**

iFlow count

1000

iFlow complexity

medium to high

(modularization, branching logic, multiple external calls, more than 25 steps per iFlow)

Intelligent Search and Analysis Tools

Governance and Quality Assurance

Validate integrations against best practices and design guidelines managed via Docs-as-Code.

Conversational Search

Query and analyze integration definitions and configurations using natural language prompts.

Anomaly Detection

Identify anomalies and atypical patterns within integration definitions and configurations.

Generative AI

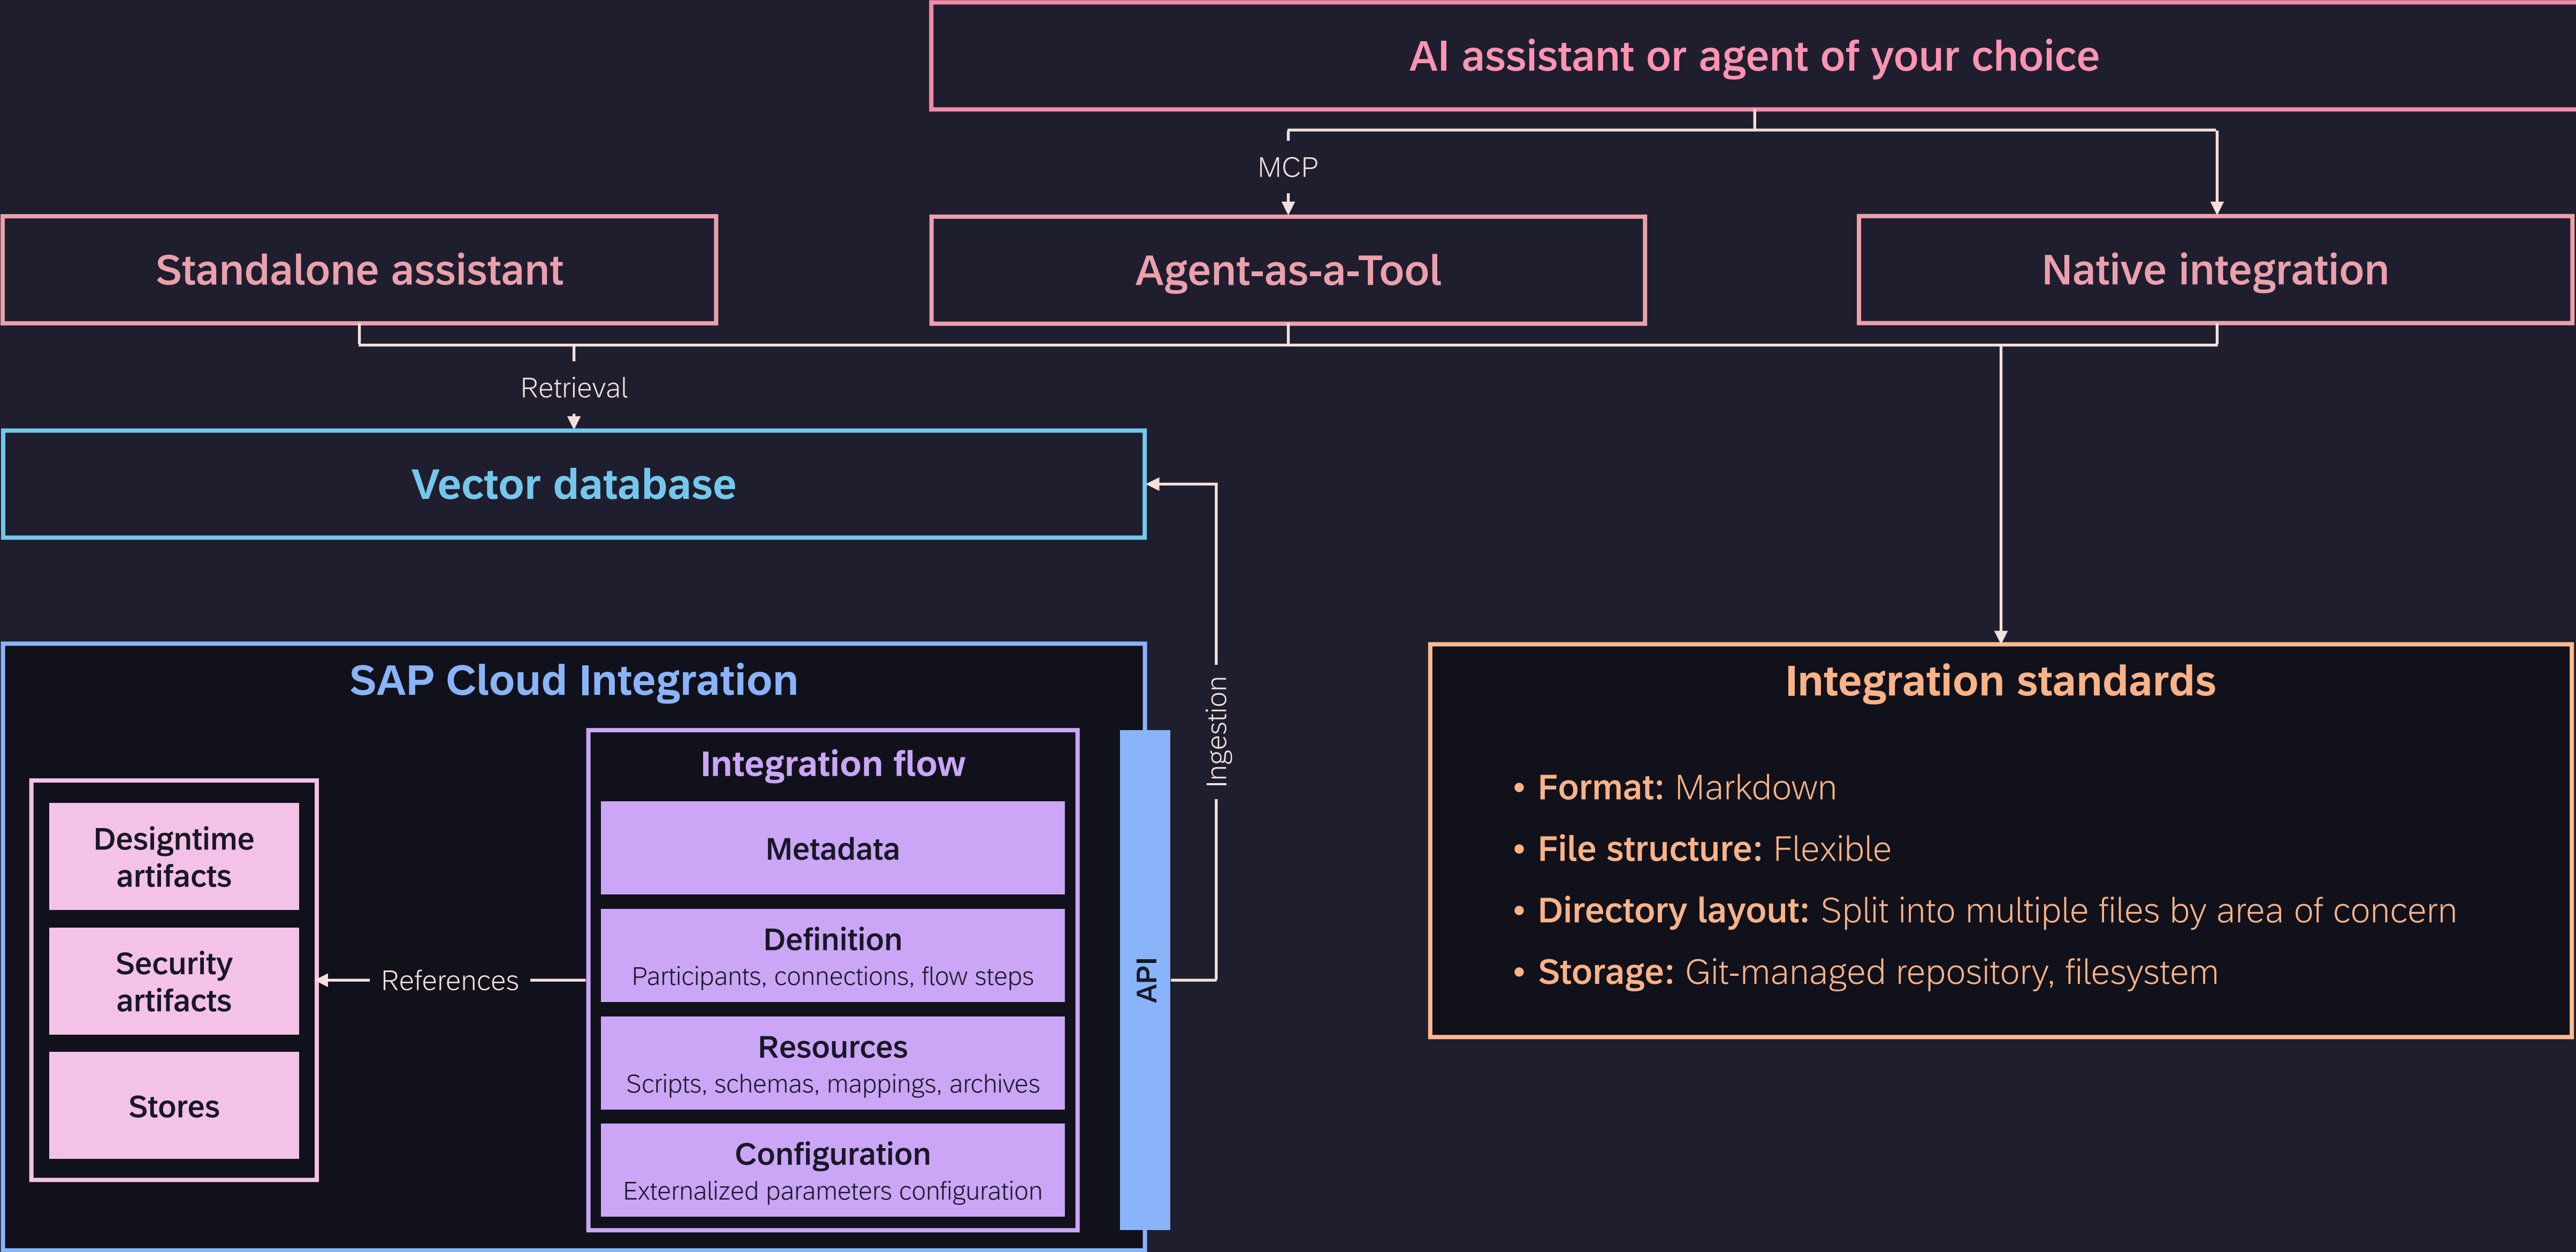

Retrieval-Augmented Generation
(RAG)

Machine Learning

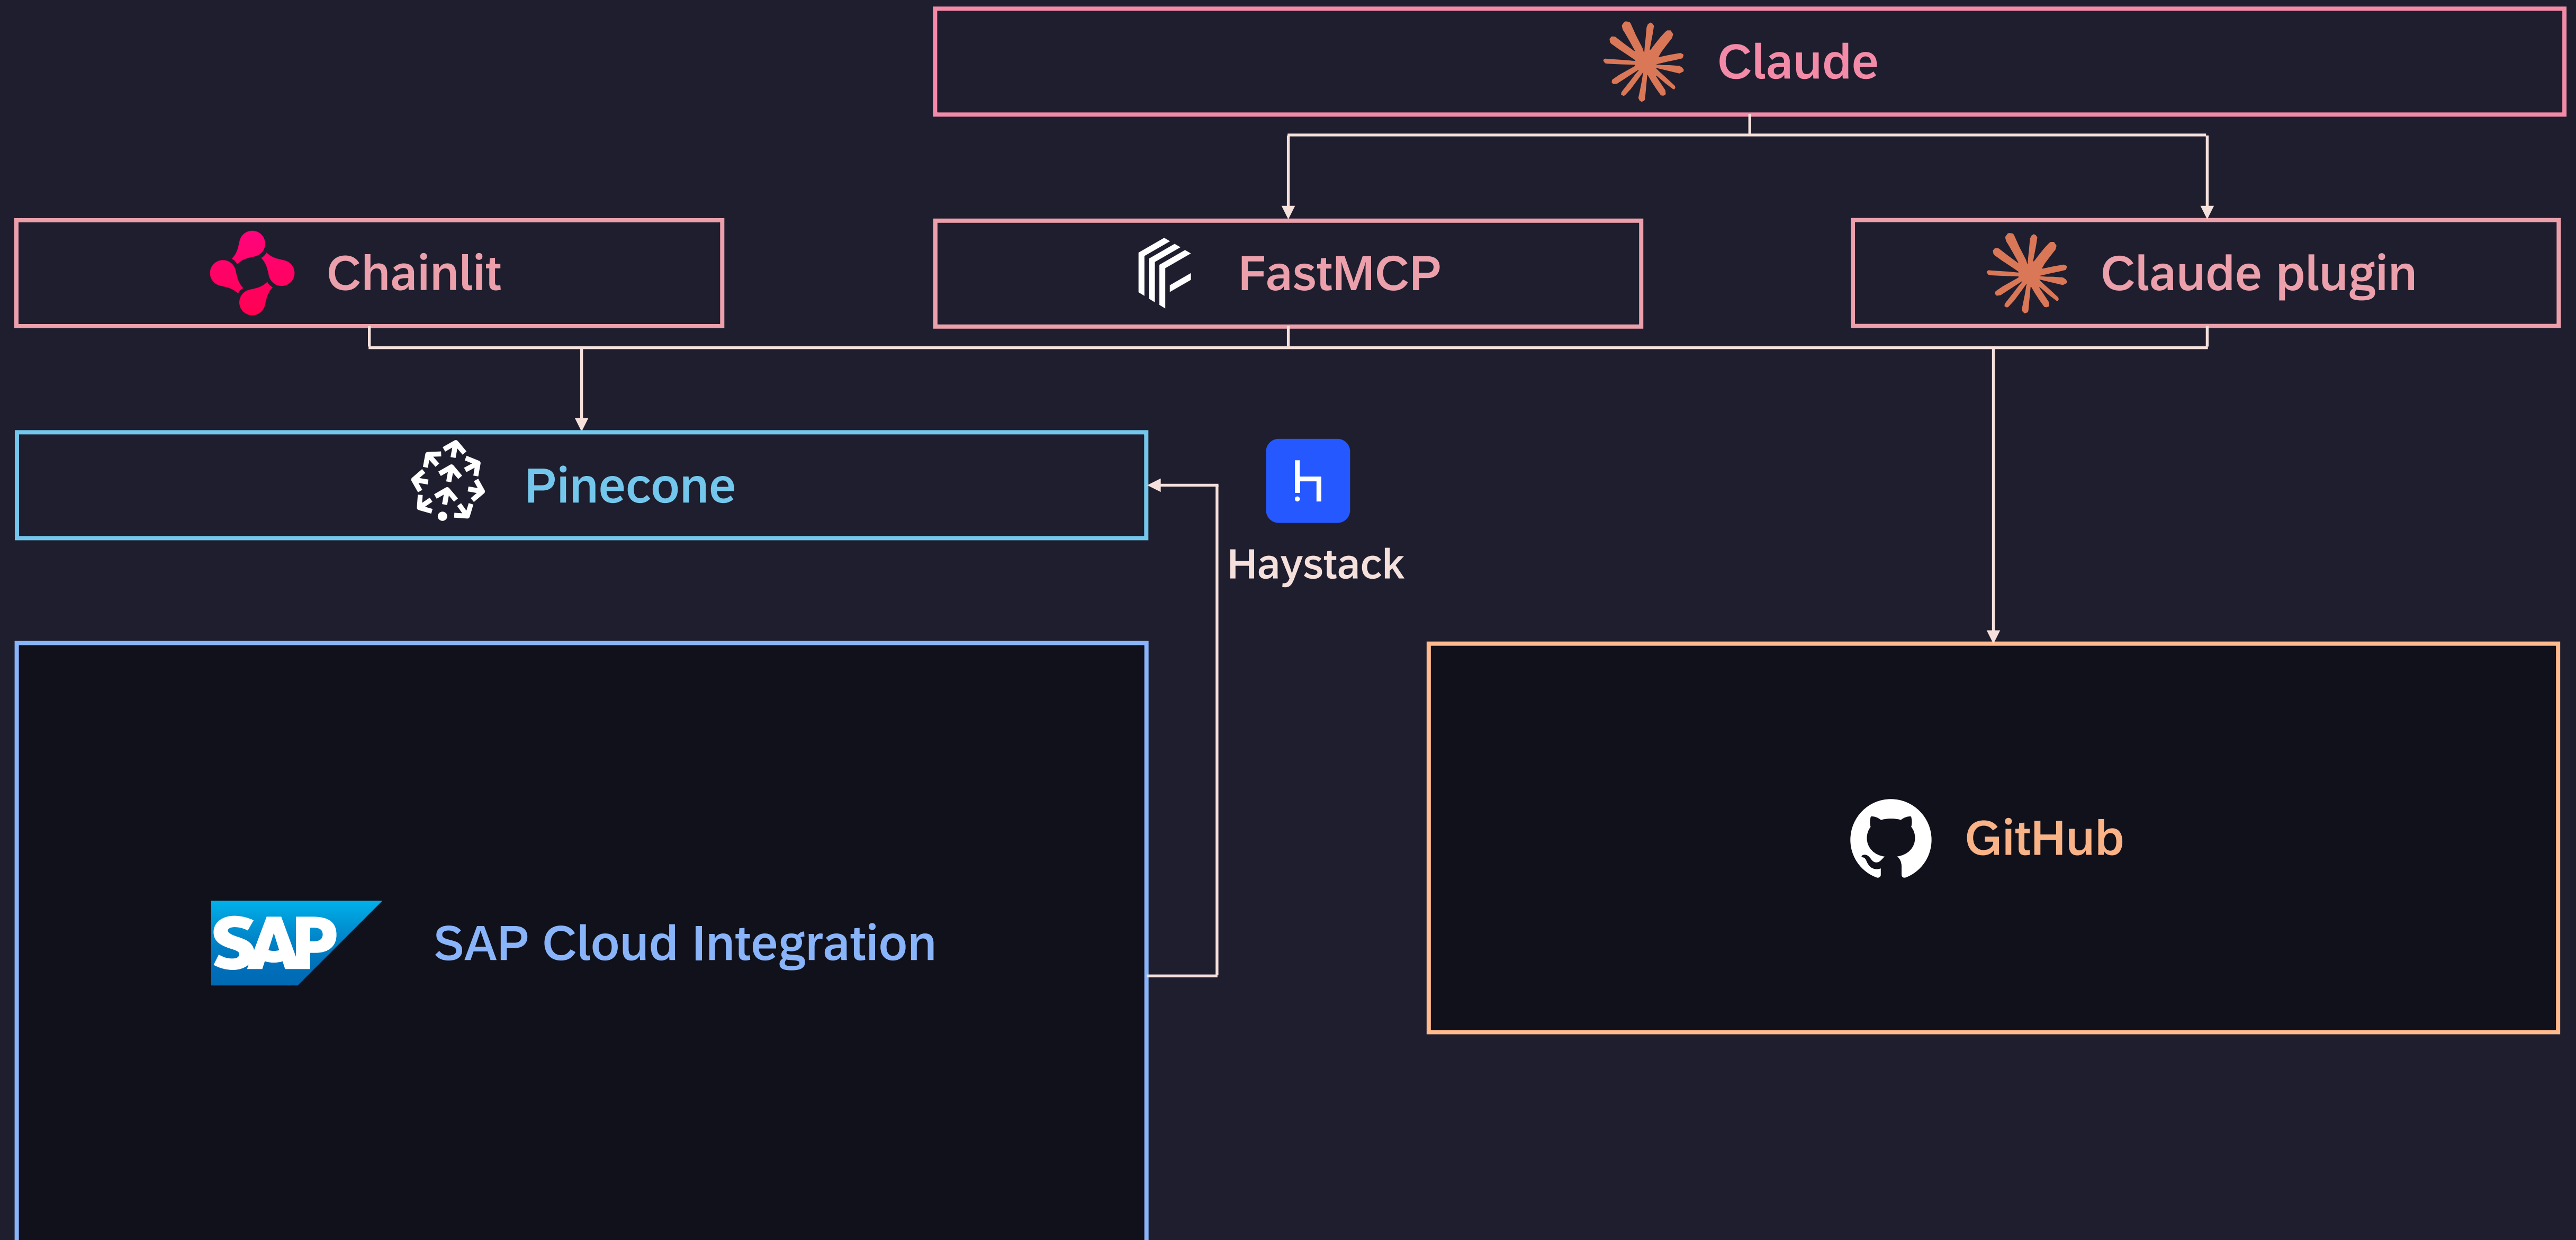

Unsupervised Transductive
Anomaly Detection

Conversational Search, Governance and Quality Assurance

Key Components

Key Components

Ingestion Pipeline

- 1** Fetch integration packages metadata
- 2** Fetch integration flows metadata
- 3** Fetch integration flows bundles
- 4** Extract integration flows definitions
- 5** Fetch integration flows externalized configuration
- 6** Chunk integration flow definitions per element
- 7** Render chunks and enrich with natural language text
- 8** Upsert chunks to vector database (incl. embedding using integrated inference)
